1 INFRARED DETECTORS AND DETECTION MODULES – SELECTED LINE

We present VIGO's most popular **infrared detectors** and **integrated detection modules**. These devices are suitable for both laboratory research as well as tests, prototyping, R&D stage, and in a variety of MWIR and LWIR industrial applications.

Main features

- High performance and reliability
- Very good repeatability in mass production
- Cost-effective solutions
- Fast delivery

Selected infrared detectors

Photo	Detector type	Photo	Detector type
	PVI-4-1×1-T039-NW-36		PVM-10.6-1×1-T039-NW-90

1.1 PVI-4-1x1-TO39-NW-36

1.1.1 2.4 – 4.5 μm HgCdTe ambient temperature, optically immersed photovoltaic detector

PVI-4-1x1-TO39-NW-36 is an uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for maximum performance at 4 μm. The detector element is monolithically integrated with hyperhemispherical GaAs microlens to improve the performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Parameter	Detector type
	PVI-4-1x1-TO39-NW-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.4 ± 0.5
Peak wavelength λ_{peak} , μm	3.4 ± 0.5
Optimum wavelength λ_{opt} , μm	4.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	4.5 ± 0.3
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm} \cdot \text{Hz}^{1/2}/\text{W}$	$\geq 4.0 \times 10^{10}$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm} \cdot \text{Hz}^{1/2}/\text{W}$	$\geq 3.0 \times 10^{10}$
Current responsivity $R(\lambda_{\text{peak}})$, A/W	≥ 2.0
Current responsivity $R(\lambda_{\text{opt}})$, A/W	≥ 1.0
Time constant τ , ns	≤ 150
Resistance R , Ω	≥ 600
Optical area A_O , mm×mm	1×1
Package	TO39
Acceptance angle Φ	$\sim 36^\circ$
Window	none

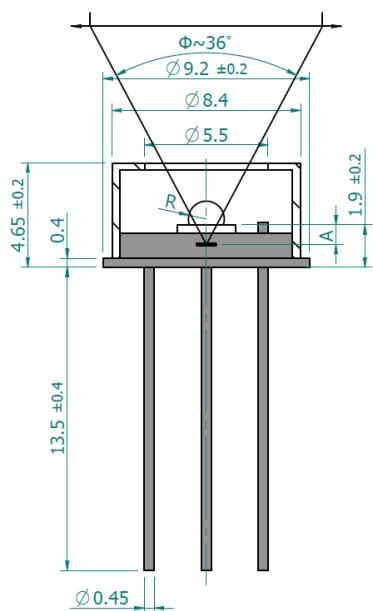

Features

- Wide dynamic range
- Convenient to use
- Very small size
- Cost-effective solution
- Quantity discounted price
- Fast delivery

Applications

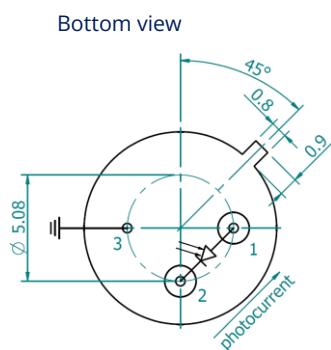

- Gas detection, monitoring, and analysis (CH_4 , C_2H_2 , CH_2O , HCl , NH_3 , SO_2 , C_2H_6)
- Breath analysis
- Explosion prevention
- Flue gas denitrification
- Emission control (exhaust fumes, greenhouse gases)

Mechanical layout, mm

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_o , mm×mm	1×1
R, mm	0.8
A, mm	2.4±0.2

Φ – acceptance angle, R – hyperhemisphere microlens radius, A – distance from the bottom of hyperhemisphere microlens to the focal plane

Function	Pin number
Detector	1, 2
Reverse bias (optional)	1(-), 2(+)
Chassis ground	3

Precautions for use and storage

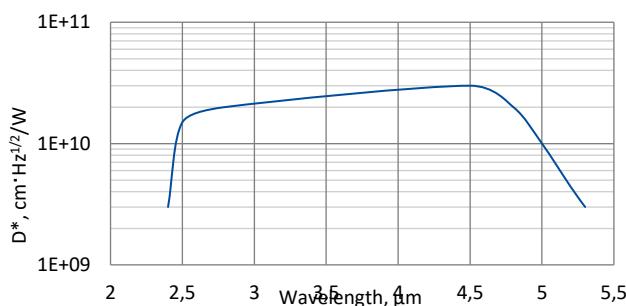

- Standard ohmmeter may overbias and damage the detector. The bias of 10 mV can be used for resistance measurements.
- Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- Beam power limitations for optically immersed detector:
 - irradiance with CW or single pulse longer than 1 µs irradiance on the apparent optical active area must not exceed 2.5 W/cm²,
 - irradiance of the pulse shorter than 1 µs must not exceed 10 kW/cm².
- Storage in a dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

1.2 PVI-5-1x1-TO39-NW-36

1.2.1 2.4 – 5.5 µm HgCdTe ambient temperature, optically immersed photovoltaic detector

PVI-5-1x1-TO39-NW-36 is an uncooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for maximum performance at 5 µm. The detector element is monolithically integrated with hyperhemispherical GaAs microlens to improve the performance of the device. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Parameter	Detector type
	PVI-5-1x1-TO39-NW-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}(10\%)$, µm	2.4 ± 0.5
Peak wavelength λ_{peak} , µm	4.2 ± 0.5
Optimum wavelength λ_{opt} , µm	5.0
Cut-off wavelength $\lambda_{\text{cut-off}}(10\%)$, µm	5.5 ± 0.3
Detectivity $D^*(\lambda_{\text{peak}})$, cm·Hz ^{1/2} /W	$\geq 3.0 \times 10^{10}$
Detectivity $D^*(\lambda_{\text{opt}})$, cm·Hz ^{1/2} /W	$\geq 1.0 \times 10^{10}$
Current responsivity $R(\lambda_{\text{peak}})$, A/W	≥ 2.0
Current responsivity $R(\lambda_{\text{opt}})$, A/W	≥ 1.0
Time constant τ , ns	≤ 150
Resistance R , Ω	≥ 100
Optical area A_0 , mm×mm	1×1
Package	TO39
Acceptance angle Φ	$\sim 36^\circ$
Window	none

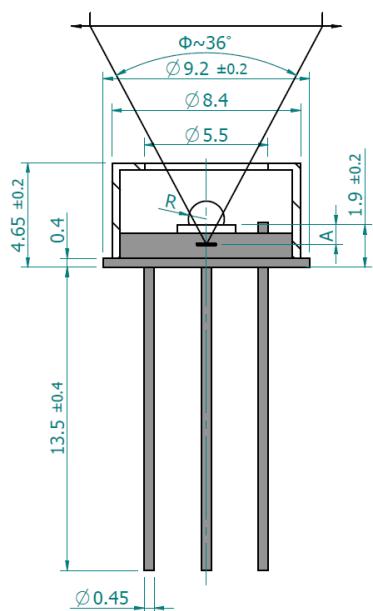

Features

- Wide dynamic range
- Convenient to use
- Very small size
- Cost-effective solution
- Quantity discounted price
- Fast delivery

Applications

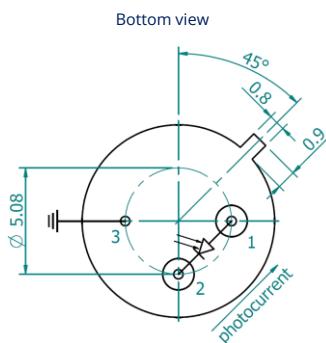

- Contactless temperature measurements (railway transport, industrial and laboratory processes monitoring)
- Flame and explosion detection
- Threat warning systems
- Gas detection, monitoring, and analysis (CO, CO₂, NO_x)
- Breath analysis
- Solids analysis
- Leakage control in gas pipelines
- Combustion process control

Mechanical layout, mm

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_o , mm×mm	1×1
R, mm	0.8
A, mm	2.4±0.2

Φ – acceptance angle, R – hyperhemisphere microlens radius, A – distance from the bottom of hyperhemisphere microlens to the focal plane

Function	Pin number
Detector	1, 2
Reverse bias (optional)	1(-), 2(+)
Chassis ground	3

Precautions for use and storage

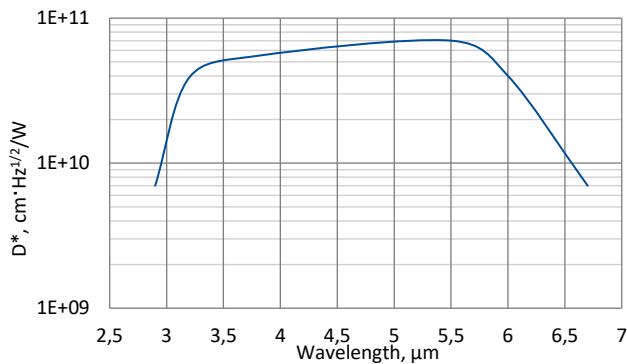

- Standard ohmmeter may overbias and damage the detector. The bias of 10 mV can be used for resistance measurements.
- Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- Beam power limitations for optically immersed detector:
 - irradiance with CW or single pulse longer than 1 µs irradiance on the apparent optical active area must not exceed 2.5 W/cm²,
 - irradiance of the pulse shorter than 1 µs must not exceed 10 kW/cm².
- Storage in a dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

1.3 PVI-2TE-6-1×1-TO8-wZnSeAR-36

1.3.1 3.0 – 6.7 µm HgCdTe two-stage thermoelectrically cooled, optically immersed photovoltaic detector

PVI-2TE-6-1×1-TO8-wZnSeAR-36 is a two-stage thermoelectrically cooled IR photovoltaic detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for maximum performance at 6 µm. The detector element is monolithically integrated with hyperhemispherical GaAs microlens to improve the performance of the device. Reverse bias may significantly increase response speed and dynamic range. 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

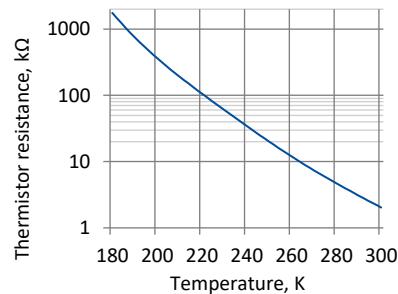

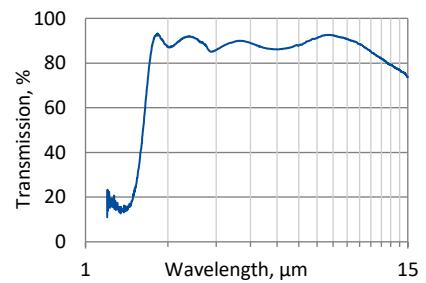

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

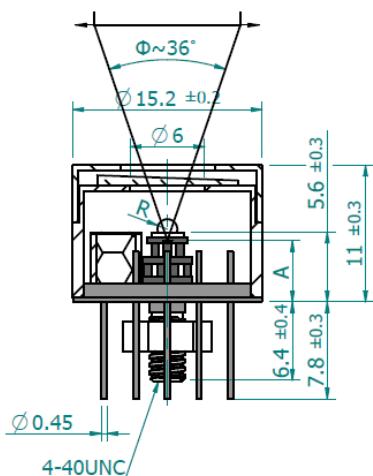

Parameter	Detector type
	PVI-2TE-6-1x1-T08-wZnSeAR-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}(10\%)$, μm	3.0 ± 1.0
Peak wavelength λ_{peak} , μm	5.2 ± 0.5
Optimum wavelength λ_{opt} , μm	6.0
Cut-off wavelength $\lambda_{\text{cut-off}}(10\%)$, μm	6.7 ± 0.3
Detector D*(λ_{peak}), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 7.0 \times 10^{10}$
Detector D*(λ_{opt}), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 4.0 \times 10^{10}$
Current responsivity $R_i(\lambda_{\text{peak}})$, A/W	≥ 2.7
Current responsivity $R_i(\lambda_{\text{opt}})$, A/W	≥ 1.5
Time constant τ , ns	≤ 50
Resistance R , Ω	≥ 200
Active element temperature T_{det} , K	~ 230
Optical area A_o , mm \times mm	1 \times 1
Package	T08
Acceptance angle Φ	$\sim 36^\circ$
Window	wZnSeAR

Two-stage thermoelectric cooler parameters

Parameter	Value
T_{det} , K	~ 230
V_{max} , V	1.3
I_{max} , A	1.2
Q_{max} , W	0.36

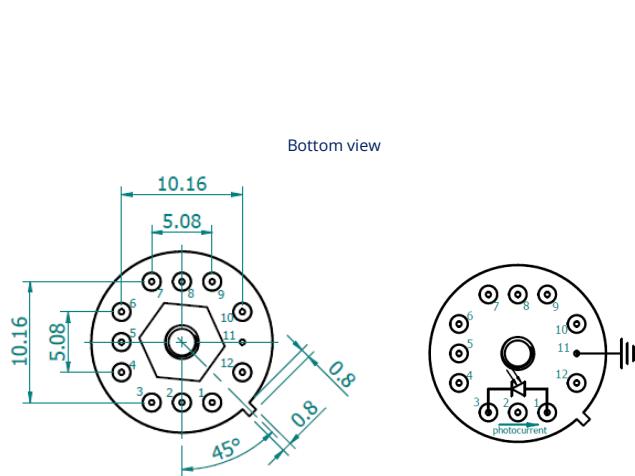

Thermistor characteristics

Spectral transmission of wZnSeAR window (typical example)

Mechanical layout, mm

Parameter	Value
Immersion microlens shape	hyperhemisphere
Optical area A_o , mm×mm	1×1
R, mm	0.8
A, mm	3.2±0.3

Φ – acceptance angle, R – hyperhemisphere microlens radius, A – distance from the bottom of the 2TE-T08 header to the focal plane

Function	Pin number
Detector	1, 3
Reverse bias (optional)	1(-), 3(+)
Thermistor	7, 9
TE cooler supply	2(+), 8(-)
Chassis ground	11
Not used	4, 5, 6, 10, 12

Precautions for use and storage

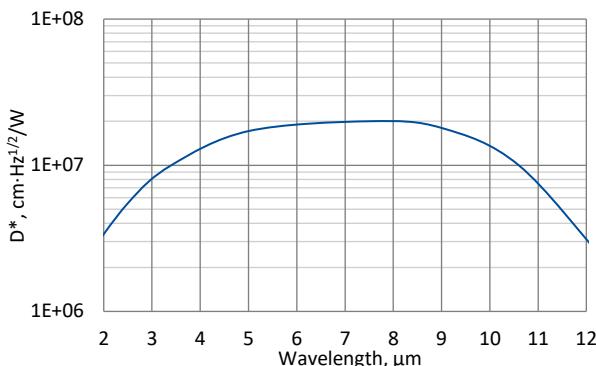

- Standard ohmmeter may overbias and damage the detector. The bias of 10 mV can be used for resistance measurements.
- Heatsink with a thermal resistance of ~2 K/W is necessary to dissipate heat generated by 2TE cooler.
- Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- Beam power limitations for optically immersed detector:
 - irradiance with CW or single pulse longer than 1 µs irradiance on the apparent optical active area must not exceed 2.5 W/cm²,
 - irradiance of the pulse shorter than 1 µs must not exceed 10 kW/cm².
- Storage in a dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

1.4 PVM-10.6-1x1-T039-NW-90

1.4.1 2.0 – 12.0 μm HgCdTe ambient temperature photovoltaic multiple junction detector

PVM-10.6-1x1-T039-NW-90 is uncooled IR photovoltaic multiple junction detector based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is designed for the maximum performance at 10.6 μm and especially useful as a large active area detector to detect CW and low frequency modulated radiation.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Detector type
	PVM-10.6-1x1-T039-NW-90
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	8.5 ± 1.5
Optimum wavelength λ_{opt} , μm	10.6
Cut-off wavelength $\lambda_{\text{cut-off}}(10\%)$, μm	≥ 12.0
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 2.0 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 1.0 \times 10^7$
Current responsivity $R(\lambda_{\text{peak}})$, A/W	≥ 0.004
Current responsivity $R(\lambda_{\text{opt}})$, A/W	≥ 0.002
Time constant t , ns	≤ 1.5
Resistance R , Ω	≥ 30
Active area A , $\text{mm} \times \text{mm}$	1x1
Package	TO39
Acceptance angle Φ	$\sim 90^\circ$
Window	none

Features

- Wide spectral range from 2.0 to 12.0 μm
- Large active area $1 \times 1 \text{ mm}^2$
- No bias required
- No flicker noise
- Short time constant $\leq 1.5 \text{ ns}$
- Operation from DC to high frequency
- Sensitive to IR radiation polarisation
- Very small size
- Convenient to use
- Versatility
- Cost-effective solution
- Quantity discounted price
- Fast delivery

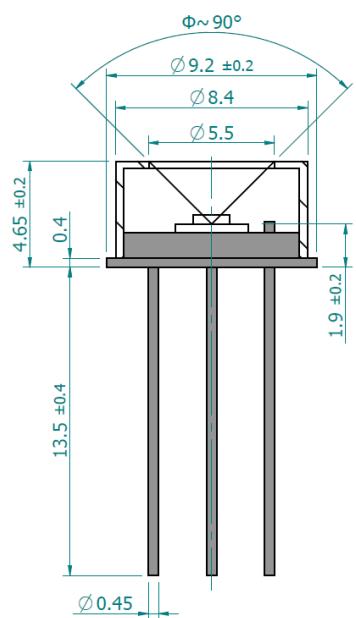

Applications

- CO_2 laser (10.6 μm) measurements
- Laser power monitoring and control
- Laser beam profiling and positioning
- Laser calibration
- Dentistry

Related product

- microM-10.6 detection module

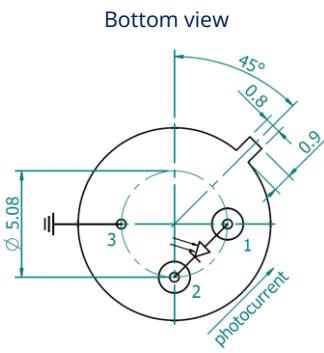

Mechanical layout, mm

Φ – acceptance angle

Precautions for use and storage

- Operation in 10% to 80% humidity and -20°C to 30°C ambient temperature.
- Beam power limitations:
 - irradiance with CW or single pulse longer than 1 µs irradiance on the apparent optical active area must not exceed 100 W/cm²,
 - irradiance of the pulse shorter than 1 µs must not exceed 1 MW/cm².
- Storage in dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

Detector	1, 2
Chassis ground	3

1.5 PCI-3TE-12-1×1-TO8-wZnSeAR-36

1.5.1 1.0 – 14.0 μm HgCdTe three-stage thermoelectrically cooled, optically immersed photoconductive detector

PCI-3TE-12-1×1-TO8-wZnSeAR-36 is a three-stage thermoelectrically cooled IR photoconductor, based on sophisticated HgCdTe heterostructure for the best performance and stability. The device is optimized for the maximum performance at 12 μm . Detector element is monolithically integrated with hyperhemispherical GaAs microlens in order to improve performance of the device. Photoconductive detector should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Detector type
	PCI-3TE-12-1×1-TO8-wZnSeAR-36
Active element material	epitaxial HgCdTe heterostructure
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	10.0 ± 0.2
Optimum wavelength λ_{opt} , μm	12.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	14.0 ± 0.2
Responsivity $R(\lambda_{\text{peak}}, 20 \text{ kHz})$, A/W	$\geq 1.6 \times 10^{-9}$
Responsivity $R(\lambda_{\text{opt}}, 20 \text{ kHz})$, A/W	$\geq 9.0 \times 10^{-8}$
Current responsivity $R(\lambda_{\text{peak}})$, A/W	≥ 0.11
Current responsivity $R(\lambda_{\text{opt}})$, A/W	≥ 0.07
Time constant τ , ns	≤ 5
Resistance R , Ω	≤ 300
Bias voltage V_b , V	≤ 1.8
1/f noise corner frequency f_c , kHz	≤ 20
Active element temperature T_{det} , K	~ 210
Optical area A_o , mm \times mm	1 \times 1
Package	TO8
Acceptance angle Φ	$\sim 36^\circ$
Window	wZnSeAR

Features

- Wide spectral range from 1.0 to 14.0 μm
- High responsivity
- Large dynamic range
- Excellent long term stability and reliability
- Quantity discounted price
- Fast delivery

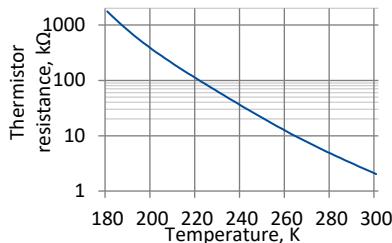

Applications

- FTIR spectroscopy and spectrometry

 - irradiance of the pulse shorter than 1 μs must not exceed 10 kW/cm²
- Storage in dark place with 10% to 90% humidity and -20°C to 50°C ambient temperature.

1.6 LabM-I-4

1.6.1 2.4 – 4.3 µm and over 5 MHz HgCdTe programmable, laboratory IR detection module with optically immersed photovoltaic detector

LabM-I-4 is a laboratory IR detection module with optically immersed photovoltaic detector based on HgCdTe heterostructure, integrated with transimpedance, programmable preamplifier. 3° wedged sapphire window prevents unwanted interference effects. For proper operation programmable „smart” VIGO thermoelctric cooler controller PTCC-01 (sold separately) and Smart Manager Software (freeware) are required. LabM-I-4 module comes complete with PTCC-01 and Smart Manager is the best solution for prototyping and R&D stage in a variety of MWIR applications. This set provides flexible approach to different needs of system designers.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, default module settings)

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.4 ± 0.5
Peak wavelength λ_{peak} , μm	3.5 ± 0.5
Optimum wavelength λ_{opt} , μm	4.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	4.3 ± 0.3
Detectivity D^* (λ_{peak} , 25 kV/A), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 2.0 \times 10^{10}$
Detectivity D^* (λ_{opt} , 25 kV/A), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.2 \times 10^{10}$
Output noise density v_n (10 MHz), $\text{nV}/\text{Hz}^{1/2}$	≤ 300
Electrical parameters	
Voltage responsivity R_v (λ_{peak} , 25 kV/A), V/W	$\geq 3.5 \times 10^4$
Voltage responsivity R_v (λ_{opt} , 25 kV/A), V/W	$\geq 2.3 \times 10^4$
Low cut-off frequency f_{lo} , Hz	DC/10 (adjustable)
High cut-off frequency f_{hi} , Hz	$\geq 5\text{M}$ (adjustable)
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	1 ($R_L = 50 \Omega$) ^{a)}
Output voltage offset V_{off} , mV	max ± 20
Other information	
Active element material	epitaxial HgCdTe heterostructure
Optical area A_0 , mm \times mm	1 \times 1
Window	wAl ₂ O ₃
Acceptance angle Φ	$\sim 36^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output socket	SMA
Power supply and TEC control socket	LEMO (female) ECG.0B.309.CLN
Mounting hole	M4
Fan	yes

^{a)} R_L – load resistance

Features

- High performance and reliability
- DC offset compensation
- Compatible with optical accessories
- Versatility and flexibility
- Quantity discounted price
- Fast delivery

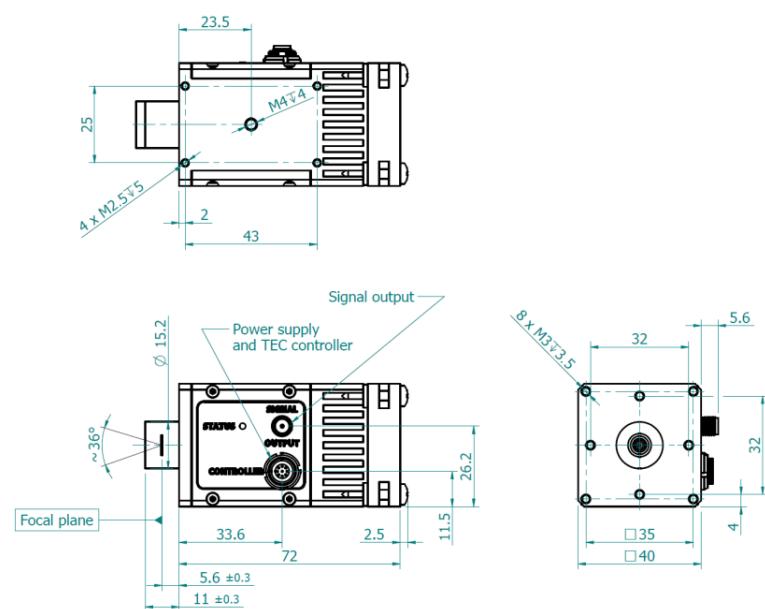

Parameters configurable by the user

- Output voltage offset
- Gain (in 40 dB range)
- Bandwidth (1.5 MHz / 5 MHz)
- Coupling AC/DC
- Detector's parameters (temperature, reverse bias etc.)

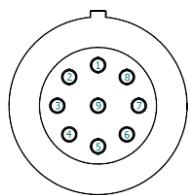

Applications

- Gas detection, monitoring and analysis (CH₄, C₂H₂, CH₂O, HCl, NH₃, SO₂, C₂H₆)
- Breath analysis
- Explosion prevention
- Flue gas denitrification
- Emission control (exhaust fumes, greenhouse gases)

Schematic diagram

Included accessories

- SMA-BNC, LEMO-DB9 cables

Dedicated accessories

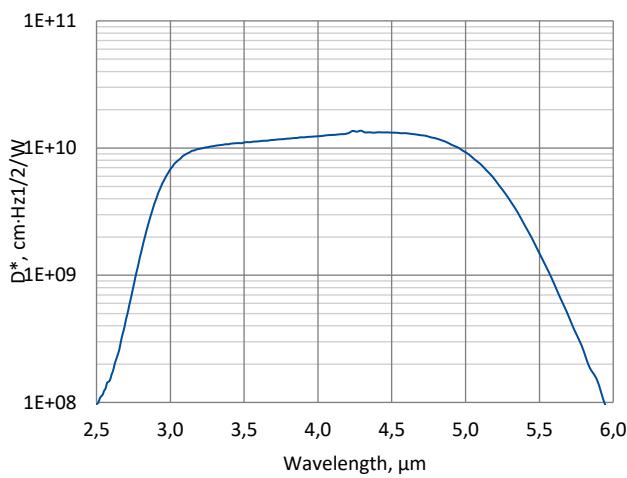

- PTCC-01-BAS TEC controller + USB: TypeA-MicroB cable + AC adaptor
- PTCC-01-ADV TEC controller + USB: TypeA-MicroB cable + AC adaptor
- PTCC-01-OEM TEC controller + USB: TypeA-MicroB, KK2-POWER cables
- OTA optical threaded adapter
- DRB-2 base mounting system

1.7 LabM-I-5

1.7.1 2.9 – 5.5 µm and over 15 MHz HgCdTe programmable, laboratory IR detection module with optically immersed photovoltaic detector

LabM-I-5 is a laboratory IR detection module with optically immersed photovoltaic detector based on HgCdTe heterostructure, integrated with transimpedance, programmable preamplifier. 3° wedged sapphire window prevents unwanted interference effects. For proper operation programmable „smart” VIGO thermoelctric cooler controller PTCC-01 (sold separately) and Smart Manager Software (freeware) are required. LabM-I-5 module comes complete with PTCC-01 and Smart Manager is the best solution for prototyping and R&D stage in a variety of MWIR applications. This set provides flexible approach to different needs of system designers.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$, default module settings)

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	2.9 ± 1.0
Peak wavelength λ_{peak} , μm	4.2 ± 0.5
Optimum wavelength λ_{opt} , μm	5.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	5.5 ± 0.3
Detectivity D^* (λ_{peak} , 25 kV/A), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.4 \times 10^{10}$
Detectivity D^* (λ_{opt} , 25 kV/A), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.0 \times 10^{10}$
Output noise density v_n (10 MHz), $\text{nV}/\text{Hz}^{1/2}$	≤ 500
Electrical parameters	
Voltage responsivity R_v (λ_{peak} , 25 kV/A), V/W	$\geq 4.8 \times 10^4$
Voltage responsivity R_v (λ_{opt} , 25 kV/A), V/W	$\geq 3.2 \times 10^4$
Low cut-off frequency f_{lo} , Hz	DC/10 (adjustable)
High cut-off frequency f_{hi} , Hz	$\geq 15\text{M}$ (adjustable)
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	1 ($R_L = 50 \Omega$) ^{a)}
Output voltage offset V_{off} , mV	max ± 20
Other information	
Active element material	epitaxial HgCdTe heterostructure
Optical area A_o , mm×mm	1×1
Window	wAl ₂ O ₃
Acceptance angle Φ	$\sim 36^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30
Signal output socket	SMA
Power supply and TEC control socket	LEMO (female) ECG.0B.309.CLN
Mounting hole	M4
Fan	yes

^{a)} R_L – load resistance

Features

- High performance and reliability
- DC offset compensation
- Compatible with optical accessories
- Versatility and flexibility
- Quantity discounted price
- Fast delivery

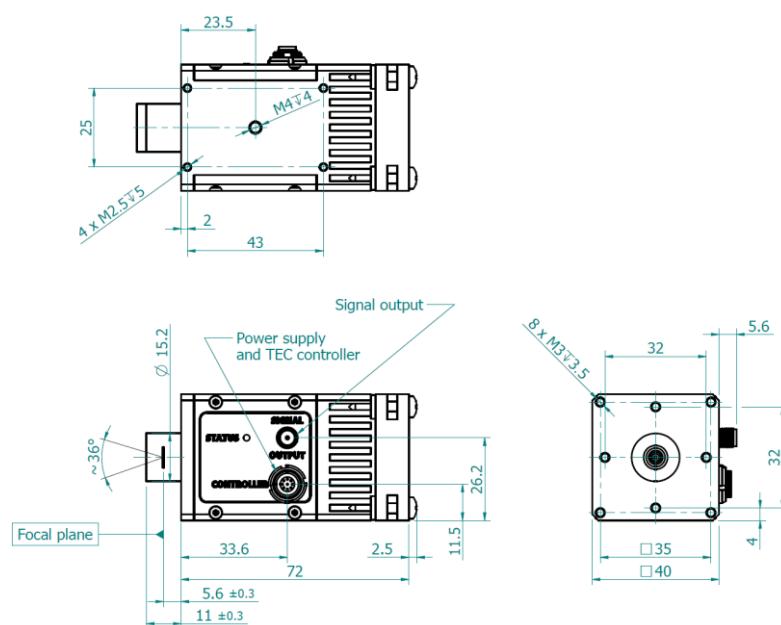

Parameters configurable by the user

- Output voltage offset
- Gain (in 40 dB range)
- Bandwidth (1.5 MHz / 15 MHz)
- Coupling AC/DC
- Detector's parameters (temperature, reverse bias etc.)

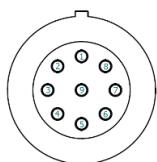

Applications

- Contactless temperature measurements (railway transport, industrial and laboratory processes monitoring)
- Flame and explosion detection
- Threat warning systems
- Gas detection, monitoring and analysis (CO, CO₂, NO_x)
- In-vivo alcohol detection
- Breath analysis
- Solids analysis
- Leakage control in gas pipelines
- Combustion process control

1.13 microM-10.6

1.13.1 2.0 – 12.0 μm and DC – 10 MHz HgCdTe micro-size IR detection module with photovoltaic multiple junction detector

microM-10.6 is a micro-size IR detection module. Uncooled photovoltaic mutiple junction detector, based on HgCdTe heterostructure, is integrated with transimpedance, DC coupled preamplifier. It is easy to assembly in space limited measuring systems of LWIR applications.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

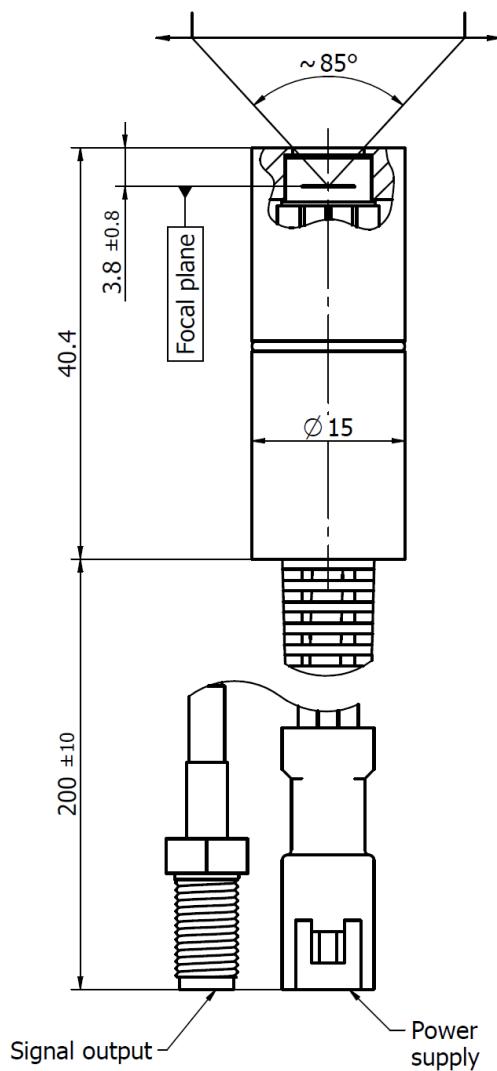

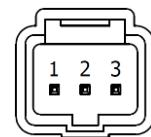

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	8.0 ± 1.5
Optimum wavelength λ_{opt} , μm	10.6
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	≥ 12.0
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.5 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 5.0 \times 10^6$
Output noise density $v_n(100 \text{ kHz})$, $\mu\text{V}/\text{Hz}^{1/2}$	≤ 1
Electrical parameters	
Voltage responsivity $R_v(\lambda_{\text{peak}})$, V/W	$\geq 1.2 \times 10^2$
Voltage responsivity $R_v(\lambda_{\text{opt}})$, V/W	$\geq 5.0 \times 10^1$
Low cut-off frequency f_{lo} , Hz	DC
High cut-off frequency f_{hi} , Hz	$\geq 10\text{M}$
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	± 1 ($R_L = 50 \Omega$ *)
Output voltage offset V_{off} , mV	max ± 20
Power supply voltage V_{sup} , V	+9
Other information

Signal output plug	SMA
Power supply plug	03T-JWPF-VSLE-S (male)
Mounting hole	none
Fan	none

*) R_L – load resistance**Features**

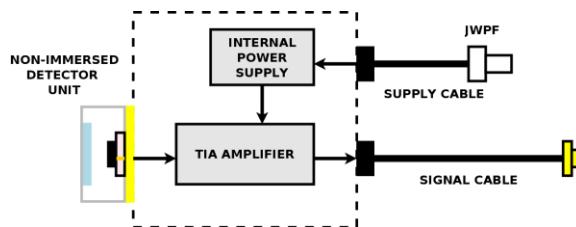

- Very small size
- Convenient to use
- Versatility
- Sensitive to IR radiation polarisation
- Cost effective OEM version available
- Quantity discounted price
- Fast delivery

Applications

- Gas detection, monitoring and analysis
- CO_2 laser ($10.6 \mu\text{m}$) measurements
- Laser power monitoring and control
- Laser beam profiling and positioning
- Laser calibration

Mechanical layout, mm**Power supply plug 03T-JWPF-VSLE-S (male)**

- MH-1 module's holder
- DRB-2 base mounting system

1.14 SM-I-12

1.14.1 2.0 – 14.0 μm and 10 Hz – 1 MHz HgCdTe small-size IR detection module with optically immersed photoconductive detector

SM-I-12 is an ultra-small IR detection module. Thermoelectrically cooled, optically immersed photoconductive detector, based on HgCdTe heterostructure (PCI-3TE-12-1×1-T08-wZnSeAR-36) is integrated with transimpedance, AC coupled preamplifier. There is a possibility to manually adjust gain of the signal. 3° wedged zinc selenide anti-reflection coated window prevents unwanted interference effects. SM-I-12 is easy to assembly in space limited measuring systems of FTIR applications.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

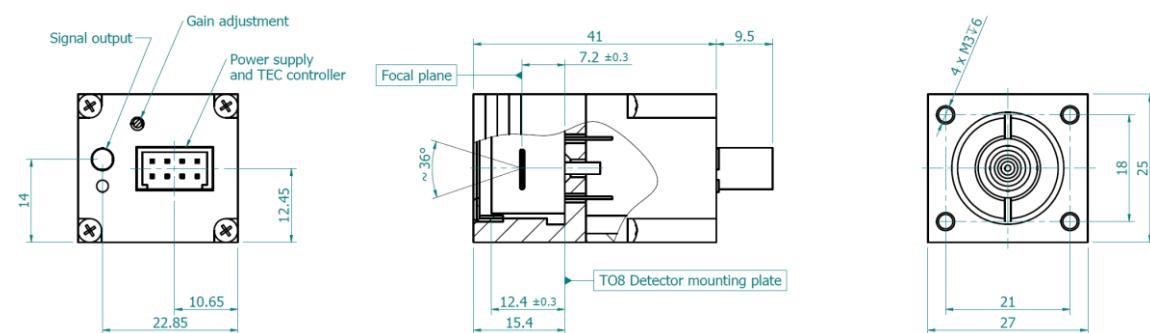

Specification ($T_a = 20^\circ\text{C}$)

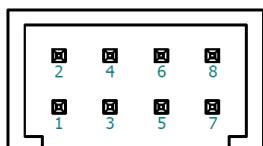

Parameter	Typical value
Optical parameters	
Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm	≤ 2.0
Peak wavelength λ_{peak} , μm	10.0 ± 0.2
Optimum wavelength λ_{opt} , μm	12.0
Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm	14.0 ± 0.2
Detectivity D^* (λ_{peak} , 20 kHz), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 2.5 \times 10^9$
Detectivity D^* (λ_{opt} , 20 kHz), $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$	$\geq 1.3 \times 10^9$
Output noise density v_n (20 kHz), $\mu\text{V}/\text{Hz}^{1/2}$	≤ 6
Electrical parameters	
Voltage responsivity R_v (λ_{peak} , 100 kV/A), V/W	$\geq 1.35 \times 10^5$
Voltage responsivity R_v (λ_{opt} , 100 kV/A), V/W	$\geq 6.30 \times 10^4$
Voltage responsivity R_v (λ_{peak} , 55 kV/A), V/W	$\geq 7.45 \times 10^4$
Voltage responsivity R_v (λ_{opt} , 55 kV/A), V/W	$\geq 3.45 \times 10^4$
Low cut-off frequency f_{lo} , Hz	10
High cut-off frequency f_{hi} , Hz	$1\text{M} \pm 0.1$
Output impedance R_{out} , Ω	50
Output voltage swing V_{out} , V	10 ($R_L = 1 \text{ M}\Omega^*$)
Output voltage offset V_{off} , mV	max ± 20
Other information	
Active element material	epitaxial HgCdTe heterostructure
Optical area A_0 , mm \times mm	1 \times 1
Window	wZnSeAR
Acceptance angle Φ	$\sim 36^\circ$
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30

2 INFRARED DETECTORS AND DETECTION MODULES - CONFIGURABLE LINE

VIGO offers various types of infrared detectors based on Mercury Cadmium Telluride, Indium Arsenide, and Indium Arsenide Antimonide featuring different parameters.

Main features

- Optimized at any wavelength from 2 – 14 µm spectral range
- With or without immersion technology
- Uncooled or thermoelectrically cooled
- Different sizes of active/optical area
- Different packages
- Different infrared windows
- Different acceptance angle
- Wide range of dedicated preamplifiers and accessories

How to choose an infrared detector?

For making a detector selection, the following points should be taken into consideration:

- wavelength or wavelength range,
- detectivity,
- speed of response.

VIGO detectors are optimized for various wavelengths. Depending on the required parameters a proper detector type should be selected.

Detector series	Spectral response range, μm															Features
	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	
HgCdTe (MCT) photoconductive detectors																<ul style="list-style-type: none"> • Broad 1 – 16 μm spectral range • Active area from 25x25 μm^2 to 4x4 mm2 • High detectivity • Low speed • Long lifetime and MTBF • Stability and reliability • 1/f noise • Uncooled and TE cooled • Immersion microlens technology available
HgCdTe (MCT) photovoltaic detectors																<ul style="list-style-type: none"> • Near BLIP detection in 3 – 6 μm range • < 10x gap to BLIP for $\lambda > 7 \mu\text{m}$ • No bias required • No 1/f noise • Bandwidth: • tens of MHz (without reverse bias) • $\geq 1\text{GHz}$ (with reverse bias) • LWIR devices limited to small areas • Uncooled and TE cooled • Immersion microlens technology available
HgCdTe (MCT) photovoltaic multiple junction detectors																<ul style="list-style-type: none"> • Wide 2 – 12 μm spectral range • Large active areas up to 4x4 mm2 • No bias required • No 1/f noise • Short time constant $\leq 1.5 \text{ ns}$ • Operation from DC to high frequency • Sensitive to IR radiation polarisation • Uncooled and TE cooled • Immersion microlens technology available
HgCdTe (MCT) photoelectromagnetic detectors																<ul style="list-style-type: none"> • Wide 2 – 12 μm spectral range • Room temperature operation • No bias required • No 1/f noise • Large active area up to 2x2 mm2 • Short time constant $\leq 1.2 \text{ ns}$ • Sensitive to IR radiation polarisation • Immersion microlens technology available
InAs and InAsSb photovoltaic detectors																<ul style="list-style-type: none"> • Spectral range 2 – 5.5 μm • Temperature stable up to 300°C • Mechanically durable • Complying with the RoHS Directive • No bias required • No 1/f noise • Sensitive to IR radiation polarisation • Uncooled and TE cooled • Immersion microlens technology available

Detector code

Different information such as detector type, optical immersion, number of stages thermoelectric cooler, the wavelength a detector is optimized for, size of active/optical area, package type, window type, and acceptance angle combine to create VIGO System's detector code.

Detector type	Immersion	-	Cooling	-	Optimal wavelength	-	Active/optical area	-	Package	-	Window	-	Acceptance angle
---------------	-----------	---	---------	---	--------------------	---	---------------------	---	---------	---	--------	---	------------------

Please see particular detector series datasheets to get available options for each detector type.

How to choose a preamplifier?

The infrared detection module integrates infrared photodetector and preamplifier in a common package.

The integration makes detectors less vulnerable to:

- over-bias,
- electrostatic discharges,
- electromagnetic interferences,
- other environmental exposures.

Additional advantages of integration are improved high-frequency performance, output signal standardization, miniaturization, and cost reduction.

The broad line of transimpedance preamplifiers is specially designed for integration with VIGO IR detectors.

Main feature	Photo	Preamplifier type	Detector type	Low cut-on frequency f_{lo} , Hz	High cut-off frequency f_{hi} , Hz	Transimpedance K , V/A	Radiator / fan	TEC controller	Mounting hole

To obtain the most optimal parameters of the integrated module each preamplifier is individually matched to the selected detector. The parameters of the integrated set will be known after the final evaluation (matching, adjustment, and final tests).

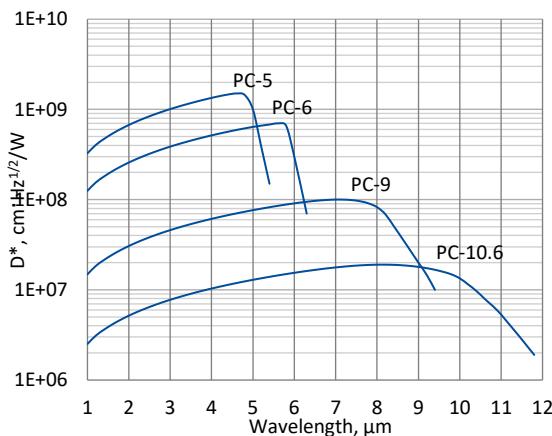

If you need any assistance in selecting VIGO product appropriate for your application, please contact **VIGO Technical Support Team**: techsupport@vigo.com.pl

2.1 PC series

2.1.1 1.0 – 12.0 μm HgCdTe ambient temperature photoconductive detectors

PC series features uncooled IR photoconductive detectors based on sophisticated HgCdTe heterostructures for the best performance and stability. The devices are optimized for the maximum performance at λ_{opt} . The devices should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The 1/f noise corner frequency increases with the cut-off wavelength.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

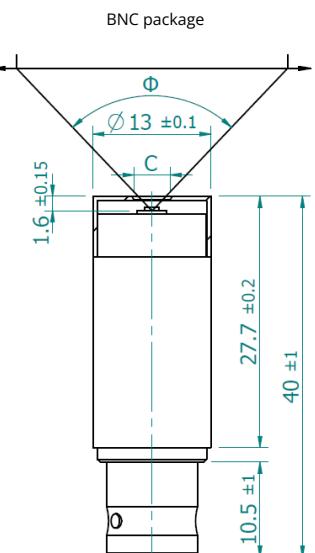

Specification ($T_a = 20^\circ\text{C}$)

2.5 PCI series

2.5.1 1.0 – 12.0 μm HgCdTe ambient temperature, optically immersed photoconductive detectors

PCI series features uncooled IR photoconductive detectors based on sophisticated HgCdTe heterostructures for the best performance and stability, optically immersed in order to improve parameters of the devices. The detectors are optimized for the maximum performance at λ_{opt} . Cut-on wavelength is limited by GaAs transmittance ($\sim 0.9 \mu\text{m}$). The devices should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The 1/f noise corner frequency increases with the cut-off wavelength.

Spectral response ($T_a = 20^\circ\text{C}$)

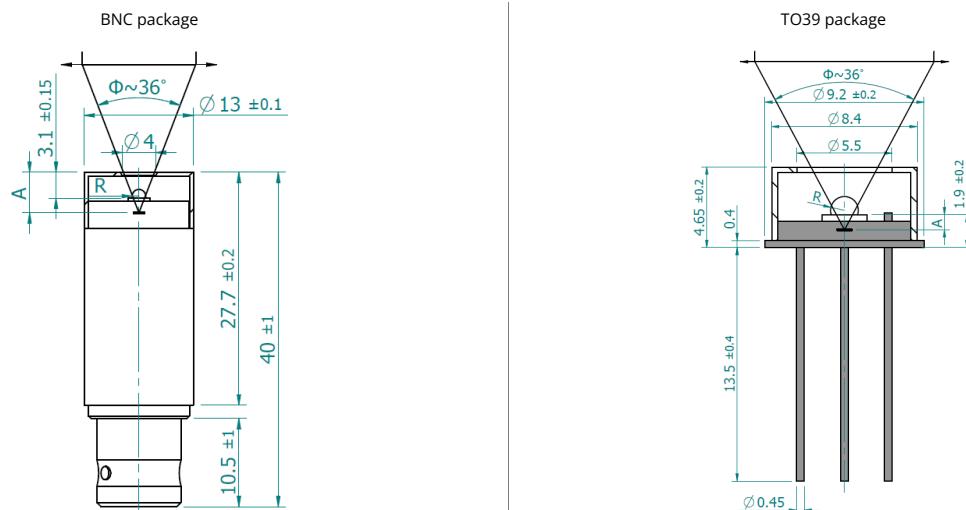

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

2.6 PCI-2TE series

2.6.1 1.0 – 15.0 μm HgCdTe two-stage thermoelectrically cooled, optically immersed photoconductive detectors

PCI-2TE series features two-stage thermoelectrically cooled IR photoconductive detectors based on sophisticated HgCdTe heterostructures for the best performance and stability, optically immersed in order to improve parameters of the devices. The detectors are optimized for the maximum performance at λ_{opt} . Cut-on wavelength is limited by GaAs transmittance ($\sim 0.9 \mu\text{m}$). The devices should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The 1/f noise corner frequency increases with the cut-off wavelength. 3° wedged sapphire (wAl₂O₃) or zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

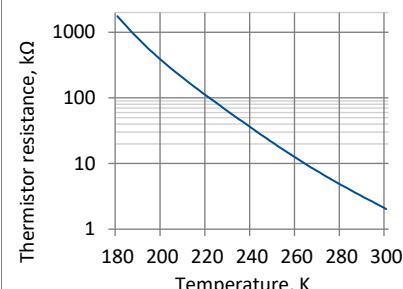

Specification ($T_a = 20^\circ\text{C}$)

2.12 PV-4TE series

2.12.1 2.0 – 12.0 μm HgCdTe four-stage thermoelectrically cooled photovoltaic detectors

PV-4TE series features four-stage thermoelectrically cooled IR photovoltaic detectors based on sophisticated HgCdTe heterostructures for the best performance and stability. The devices are optimized for the maximum performance at λ_{opt} . Cut-on wavelength can be optimized upon request. Reverse bias may significantly increase response speed and dynamic range. It also results in improved performance at high frequencies, but 1/f noise that appears in biased devices may reduce performance at low frequencies. 3° wedged sapphire (wAl₂O₃) or zinc selenide anti-reflection coated (wZnSeAR) window prevents unwanted interference effects.

Spectral response ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ mV}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

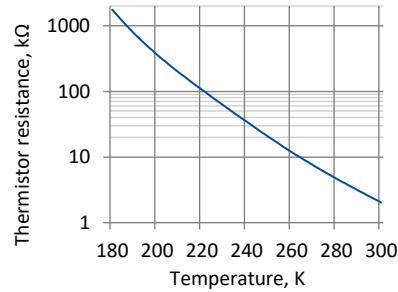

Specification ($T_a = 20^\circ\text{C}$, $V_b = 0 \text{ V}$)

2.19 PVMI series

2.19.1 2.0 – 12.0 μm HgCdTe ambient temperature, optically immersed photovoltaic multiple junction detectors

PVMI series features uncooled IR photovoltaic multiple junction detectors based on sophisticated HgCdTe heterostructures for the best performance and stability, optically immersed in order to improve parameters of the devices. The detectors are optimized for the maximum performance at λ_{opt} . They are especially useful as large optical area detectors operating within 2 to 12 μm spectral range.

Spectral response ($T_a = 20^\circ\text{C}$)

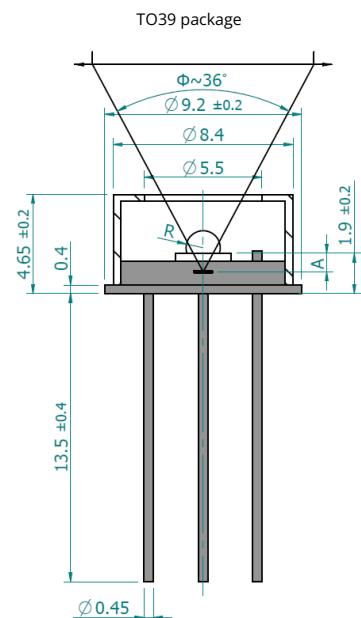

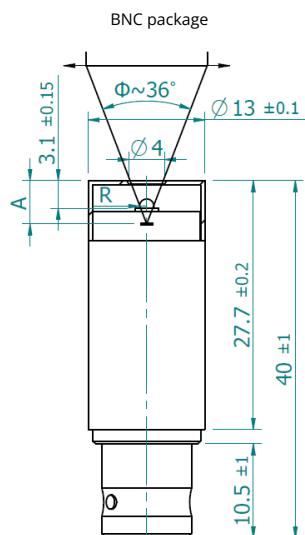

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Detector type	
	PVMI-8	PVMI-10.6
Active element material	epitaxial HgCdTe heterostructure	
Optimum wavelength λ_{opt} , μm	8.0	10.6
Detectivity $D^*(\lambda_{\text{peak}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 6.0 \times 10^8$	$\geq 2.0 \times 10^8$
Detectivity $D^*(\lambda_{\text{opt}})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 3.0 \times 10^8$	$\geq 1.0 \times 10^8$
Current responsivity-optical area length product $R(\lambda_{\text{opt}}) \cdot L_o$, $\text{A} \cdot \text{mm} / \text{W}$	≥ 0.04	≥ 0.01
Time constant τ , ns	≤ 4	≤ 1.5
Resistance R , Ω	50 to 300	20 to 150

2.29 PCQ

2.29.1 1.0 – 12.0 μm HgCdTe ambient temperature photoconductive quadrant detector

PCQ is uncooled IR photoconductive quadrant detector based on sophisticated HgCdTe heterostructures for the best performance and stability. Quadrant detector consists of four separate active elements arranged in a quadrant geometry. The device is optimized for the maximum performance at 10.6 μm . The detector should operate in optimum bias voltage and current readout mode. Performance at low frequencies is reduced due to 1/f noise. The main application of PCQ detectors is laser beam profiling and positioning.

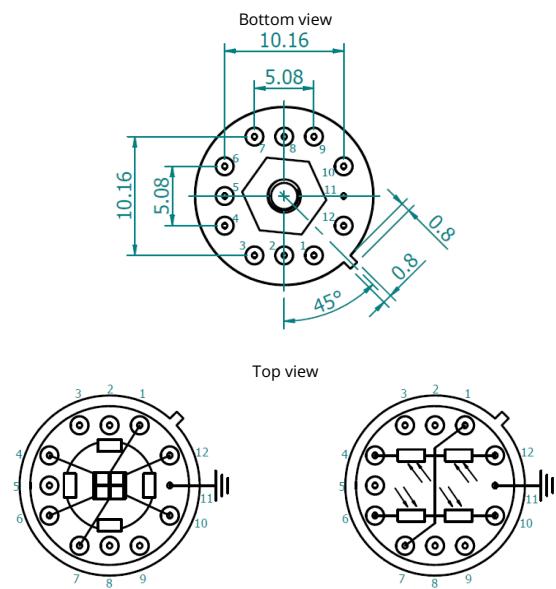

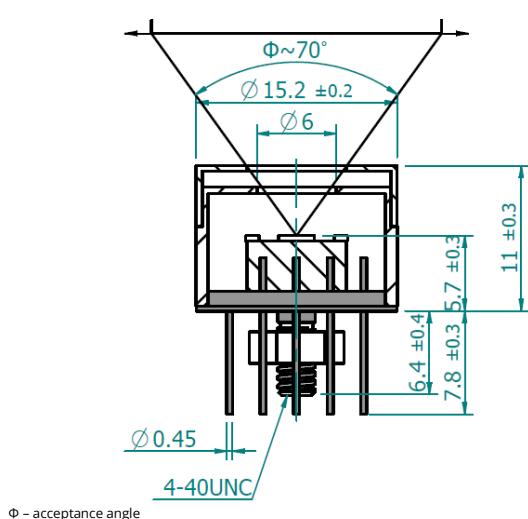

Spectral response ($T_a = 20^\circ\text{C}$)

Exemplary spectral detectivity, the spectral response of delivered devices may differ.

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Detector type
	PCQ-10.6
Active elements material	epitaxial HgCdTe heterostructure
Optimum wavelength λ_{opt} , μm	10.6
Detectivity $D^*(\lambda_{\text{peak}}, 20\text{kHz})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 1.9 \times 10^7$
Detectivity $D^*(\lambda_{\text{opt}}, 20\text{kHz})$, $\text{cm} \cdot \text{Hz}^{1/2} / \text{W}$	$\geq 9.0 \times 10^6$
Current responsivity $R(\lambda_{\text{opt}})$, A/W	≥ 0.001
Time constant τ , ns	≤ 5
1/f noise corner frequency f_c , Hz	$\leq 20\text{k}$
Bias voltage-active area length ratio V_b/L , V/mm	≤ 6.0
Resistance R , Ω	≤ 240
Active area of single element A, mm \times mm	1 \times 1
Distance between elements, μm	50
Package	TO8
Acceptance angle Φ	$\sim 70^\circ$
Window	none

Mechanical layout, mm

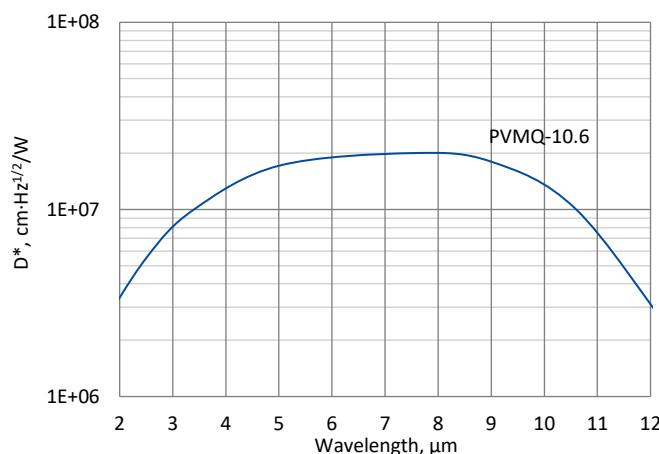

Function	Pin number
Detector 1	12
Detector 2	10
Detector 3	6
Detector 4	4
Common	1, 7

2.31 AIP series

AIP is a new generation of transimpedance, AC or DC coupled preamplifiers. It is designed to operate with either biased or non-biased VIGO detectors. AIP is an „all-in-one” device – a preamplifier is integrated with a fan and a thermoelectric cooler controller in a compact housing. It is a very convenient and user-friendly device, thus can be easily used in a variety of applications.

Features

- Integrated TEC controller and fan
- Frequency bandwidth up to 250 MHz
- Single power supply
- DC monitor
- Optimised for effective heat dissipation
- Compatible with optical accessories
- Cost-effective OEM version available
- Universal and flexible

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC, 10, 100, 1k, 10k	
High cut-off frequency f_{hi} , Hz	100k, 1M, 10M, 100M, 250M	
Transimpedance K_i , V/A	up to 200k	fixed
Output impedance R_{out} , Ω	50	
Output voltage swing V_{out} , V	± 2 ± 1	$f_{hi} \leq 1 \text{ MHz}, R_L = 1 \text{ M}\Omega^*)$ $f_{hi} > 1 \text{ MHz}, R_L = 50 \text{ }\Omega^*)$
Output voltage offset V_{off} , mV	max $\pm 20^{**}$	
Power supply voltage V_{sup} , V	+5 +12	with 2TE and 3TE cooled detectors with 4TE cooled detectors
Power supply current I_{sup} , mA	max ± 50	
Ambient operating temperature T_a , $^\circ\text{C}$	10 to 30	
Signal output socket	SMA	RF output
DC output socket	SMA	DC monitor
Supply socket	DC 2.1/5.5 DC 2.5/5.5	$V_{sup} = +12 \text{ V}$ $V_{sup} = +5 \text{ V}$
Mounting hole	M4	
Fan	yes	

*) R_L – load resistance

Dedicated accessories

- **OTA** optical threaded adapter
- **DRB-2** base mounting system

Mechanical layout, mm

2.32 PIP series

PIP is a series of programmable “smart” preamplifiers. Due to the modern internal configuration, it offers extreme flexibility combined with superior signal parameters and high reliability. Built-in voltage monitor allows to check and optimize the working conditions (supply voltages, detector bias voltage, first and last stage output voltage offset, etc.).

There is also possible to change the gain, coupling (AC/DC), optimize the first stage transimpedance, and manually or automatically suppress the voltage offset.

Optimized parameters are stored into the internal EEPROM memory and automatically loaded after the power is on. Reset to default settings is available at any time. For detection module safety detector bias adjusting is blocked by default. Users can request to enable this option while ordering.

For proper operation, PTCC-01 TEC controller is required.

Parameters configurable by the user

- Output voltage offset
- Gain (in 40 dB range)
- Bandwidth
- 150 kHz/1.5 MHz/20 MHz
- 1.5 MHz/15 MHz/200 MHz
- Coupling AC/DC
- Detector's parameters (temperature, reverse bias etc.)

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC/10	user-configurable by software
High cut-off frequency f_{hi} , Hz	150k/1.5M/20M 1.5M/15M/200M	user-configurable by software
Transimpedance K_i , V/A	2.5k - 150k 0.5k - 30k	digitally adjustable first stage transimpedance = 1 kΩ first stage transimpedance = 5 kΩ
Output impedance R_{out} , Ω	50	
Output voltage swing V_{out} , V	±1	$R_L = 50 \Omega^{*)}$
Output voltage offset V_{off} , mV	max ±20**)	
Ambient operating temperature T_a , °C	10 to 30

2.33 MIP series

MIP is a series of medium-size transimpedance, DC or AC coupled preamplifiers, intended to operate with either biased or non-biased VIGO detectors. MIP is equipped with a fan and does not require any additional external heatsink. It is one of the most user-friendly preamplifiers which surely facilitate work.

Features

- Frequency bandwidth up to 250 MHz
- Integrated fan
- Compatible with optical accessories

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	DC, 10, 100, 1k, 10k	
High cut-off frequency f_{hi} , Hz	100k, 1M, 10M, 100M, 250M

2.34 FIP series

FIP is a series of high speed, transimpedance, AC coupled preamplifiers, intended to operate with biased TE cooled VIGO detectors. Fast preamplifier enables precise I-V conversion, detector biasing up to 800 mV and simultaneously maintains compact size and keeps current noise low. FIP is equipped with a fan and does not require additional heat dissipation. It is suitable for applications requiring wide frequency bandwidth. Additional DC output is available as an option.

Features

- Wide frequency bandwidth up to 1 GHz
- Integrated fan
- DC monitor as an option

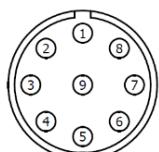

Specification ($T_a = 20^\circ\text{C}$)

Parameter	Typical value	Conditions, remarks
Low cut-off frequency f_{lo} , Hz	1k, 10k	
High cut-off frequency f_{hi} , Hz	1G	
Transimpedance K, V/A	up to 8.5k	fixed
Output impedance R_{out} , Ω	50

2.35 SIP series

SIP is a series of ultra-small transimpedance, AC or DC coupled preamplifiers. It is designed to operate with either biased or non-biased detectors. It is compatible with uncooled detectors in TO39 package (SIP-TO39) or thermoelectrically cooled detectors in TO8 package (SIP-TO8). SIP is dedicated for OEM applications and requires an external heatsink (MHS-2). There is a possibility to adjust the gain (devices with a frequency bandwidth up to 100 MHz).

Features

- Very small size
- Frequency bandwidth up to 250 MHz
- Adjustable gain as an option

SIP-TO8

3.4 DRB-2 base mounting system

DRB-2 is a stable base mounting system dedicated to VIGO detection modules with M4 mounting hole and VIGO uncooled detectors in BNC and PEM-SMA packages. DRB-2 has adjustable height and is compatible with M6 optical breadboards.

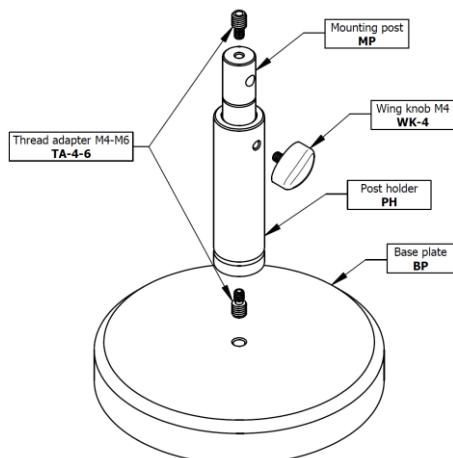

DRB-2 consists of:

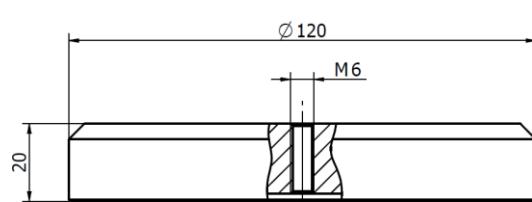

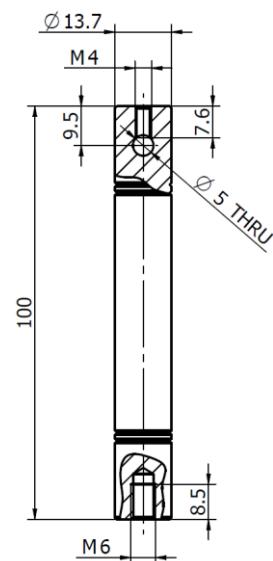

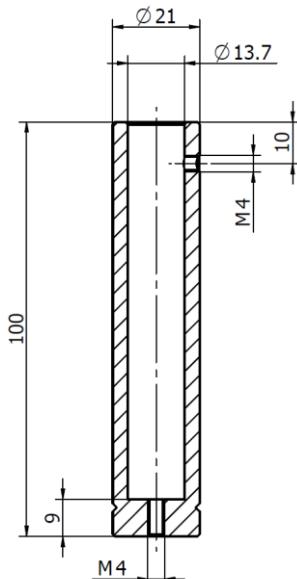

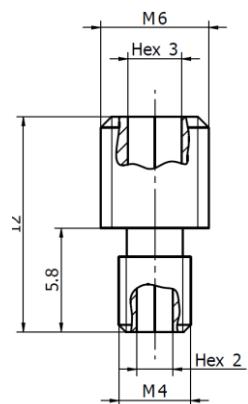

- base plate BP
- mounting post MP
- post holder PH

BP is a base plate made of black, lacquered steel. It provides mechanical stable conditions for the mounting system. Weight: 1756 g.

MP is a mounting post made of stainless steel. It is equipped with two thread adapters TA-4-6. Weight: 115 g.

PH is a post holder made of black anodized aluminum. It is equipped with a wink knob WK-4. Weight: 60 g.

Mechanical layout, mm**Base plate BP****Mounting post MP****Post holder PH****Thread adapter M4-M6**

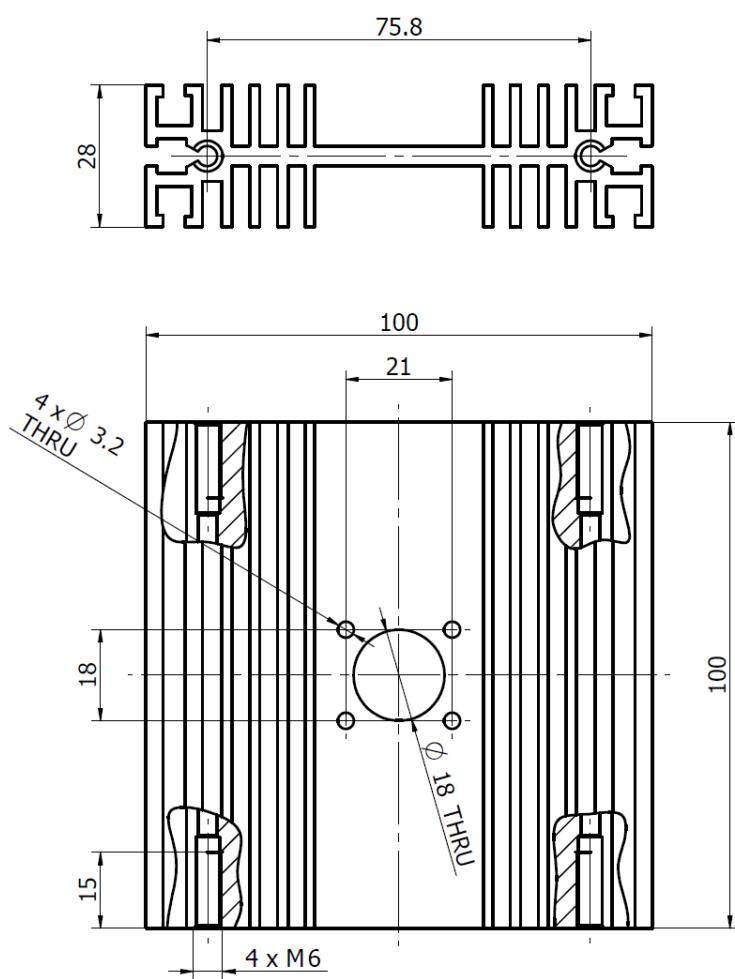

3.5 MHS-2 DH-2 MH-1 OTA

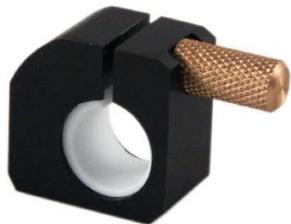

MHS-2 heatsink

MHS-2 is an external heatsink made of black anodized aluminum, dedicated for OEM VIGO detection modules integrated with TE cooled detectors and preamplifier SIP-TO8. It provides suitable dissipation of heat generated by the Peltier cooler. Its thermal resistance is ~1.5 K/W.

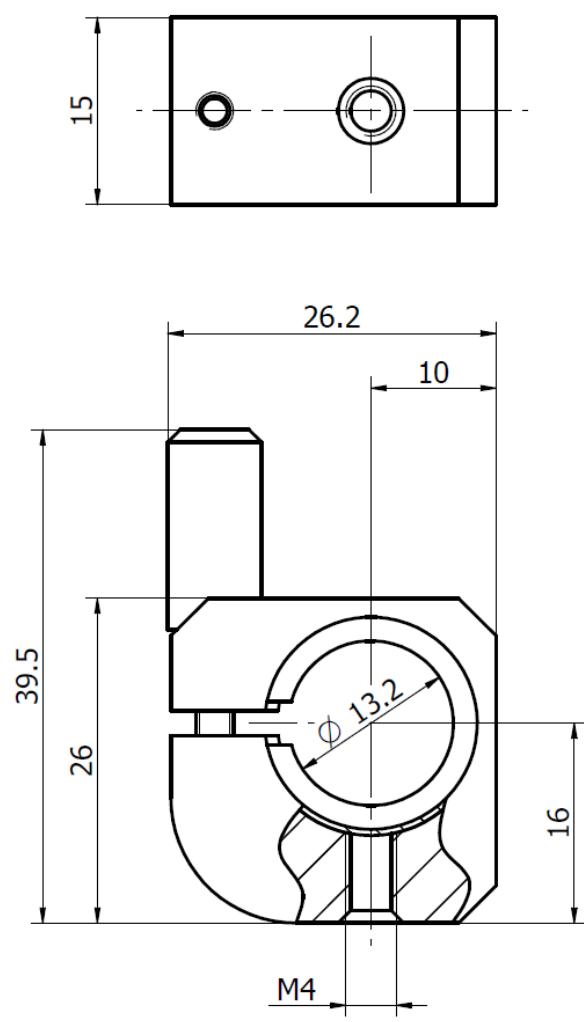

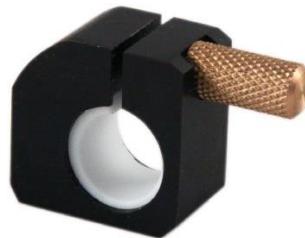

Mechanical layout, mm

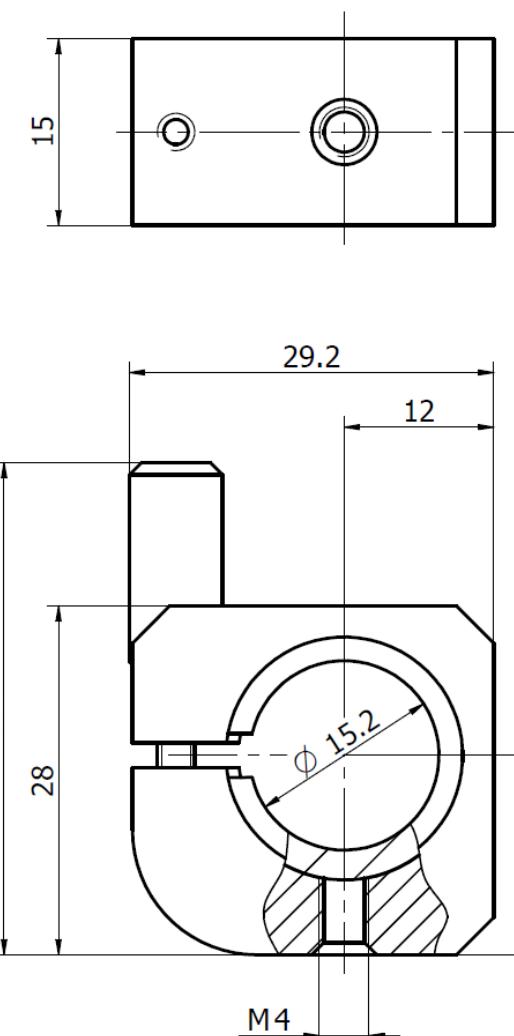

DH-2 detector holder

DH-2 is a detector holder with M4 mounting hole, dedicated for assembly VIGO uncooled detectors in BNC and PEM-SMA packages. It is compatible with DRB-2 mounting system.

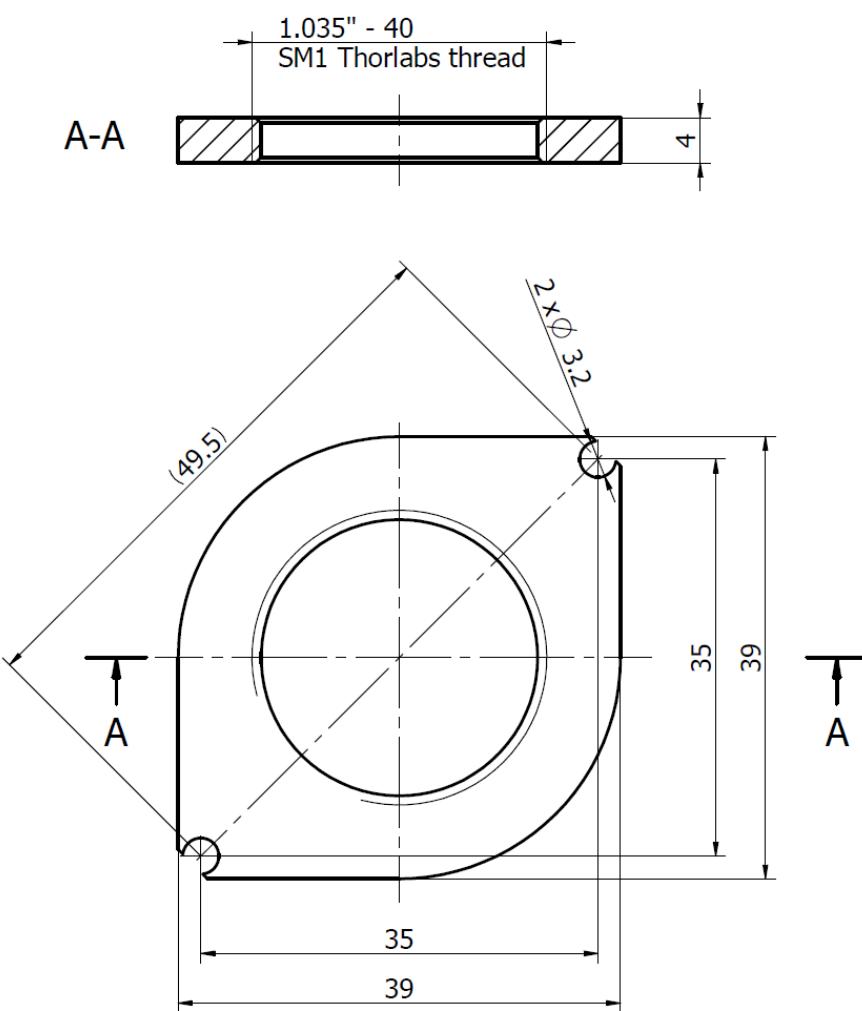

Mechanical layout, mm**MH-1 module holder**

MH-1 is a module holder with M4 mounting hole, dedicated for assembly VIGO microM-10.6 detection modules. It is compatible with DRB-2 mounting system.

Mechanical layout, mm

OTA optical threaded adapter

OTA is an optical threaded adapter made of black anodized aluminum. It is an accessory that allows building complex systems containing VIGO detection modules (AIP, MIP, PIP) and optical components.
OTA is compatible with all types of Thorlabs SM1 threaded lens tubes.

**Mechanical layout, mm**

4 GLOSSARY AND TECHNICAL INFORMATION

4.1 Glossary

Infrared detectors

Infrared photodetectors are semiconductor electro-optical devices that convert infrared radiation into an electrical signal.

Photoconductive detectors PC

Photoconductive detectors based on the photoconductive effect. Infrared radiation generates charge carriers in the semiconductor active region decreasing its resistance. The resistance change is sensed as a current change by applying a constant voltage bias. The devices are characterized by near-linear current-voltage characteristics. The electric field E in photoconductors is constant across the device. It equals the ratio of bias voltage V_b and distance between contacts L :

$$E = \frac{V_b}{L}$$

The optimum bias voltage is specified in the Final test report (supplied with each VIGO device) and depends on detector size, operating temperature, and spectral response.

Photovoltaic detectors PV, PVM

Photovoltaic detectors (photodiodes) are semiconductor structures with one (PV) or multiple (PVM), homo- or heterojunctions. Absorbed photons produce charge carriers that are collected at the contacts, resulting in external photocurrent. Photodiodes have complex current-voltage characteristics. The devices can operate either at flicker-free zero bias or with reverse voltage. A reverse bias voltage is frequently applied to increase responsivity, differential resistance, improve high-frequency performance and increase the dynamic range. Unfortunately, at the expense of flicker noise $1/f$ in most cases.

Photovoltaic detectors are more vulnerable to electrostatic discharges than photoconductors.

Photoelectromagnetic detectors PEM

Photovoltaic detectors are based on the photoelectromagnetic effect based on spatial separation of optically generated electrons and holes in the magnetic field. The devices do not require electrical bias and show no flicker noise $1/f$. The PEM devices are typically used as fast, uncooled detectors of long-wavelength radiation.

Active element material $Hg_{1-x}Cd_xTe$

$Hg_{1-x}Cd_xTe$ also known as Mercury Cadmium Telluride, MCT, $HgCdTe$, $(Cd, Hg)Te$, or MerCardTel. It is a variable bandgap alloy, commonly used for the fabrication of photodetectors with a tunable spectral response.

Active element material $InAs_{1-x}Sb_x$

$InAs_{1-x}Sb_x$ also known as Indium Arsenide Antimonide or $InAsSb$ is another variable bandgap alloy used for the fabrication of photodetectors with a tunable spectral response.

Active area A, mm×mm

The physical area of a photosensitive element is the active region that converts incoming optical radiation into the electric output signal.

$$A = W \text{ (width)} \times L \text{ (length)}.$$

In photoconductors, L is a distance between contacts.

Optical area A_o , mm×mm

The apparent optical area of the detector is "seen". It is equal to the physical area of the detector active element unless an optical concentrator is used. The optical detector area can be significantly magnified in detectors supplied with optical concentrators, i.e. immersion microlenses (Chapter [Optical immersion technology](#)).

$$A_o = W_o \text{ (width)} \times L_o \text{ (length)}.$$

Cut-on wavelength $\lambda_{\text{cut-on}}$ (10%), μm

The shorter wavelength at which a detector responsivity reaches 10% of the peak value.

Peak wavelength λ_{peak} , μm

The wavelength of detector maximum responsivity.

Cut-off wavelength $\lambda_{\text{cut-off}}$ (10%), μm

The longer wavelength at which a detector responsivity reaches 10% of the peak value.

Normalized detectivity D^* , $\text{cm}\cdot\text{Hz}^{1/2}/\text{W}$

The signal-to-noise ratio (SNR) at a detector output normalized to 1 W radiant power, a 1 cm^2 detector optical area, and a 1 Hz noise bandwidth.

Noise equivalent power NEP, $\text{nW}/\text{Hz}^{1/2}$

The incident power on the detector generates a signal output equal to the 1 Hz bandwidth noise output. Stated another way, the NEP is the signal level that produces a signal-to-noise ratio (SNR) of 1.

Photocurrent I_{ph}

The photocurrent is the current generated by infrared radiation, which is not in thermal equilibrium with the detector. For small irradiation, the photocurrent is proportional to incident radiation power P .

$$I_{\text{ph}} = R_i \cdot P$$

R_i is the current responsivity.

Current responsivity R_i , A/W

Current responsivity is the ratio of photocurrent and power of radiation. The current responsivity is typically measured for monochromatic radiation (the spectral current responsivity) and blackbody radiation (the blackbody current responsivity). The responsivity typically remains constant for weak radiation and tends to decrease with more strong radiation.

Current responsivity-active area length product $R_i \cdot L$ and current responsivity-optical area length product $R_i \cdot L_o$, $\text{A}\cdot\text{mm}/\text{W}$

The current responsivity of unbiased PEM, PVM, and biased (with constant electric field E) PC detectors is proportional to the reciprocal active area length L (optical area length L_o). Therefore, the current responsivity $R_i \cdot L$ ($R_i \cdot L_o$) is used to compare devices of various formats.

Another normalized current responsivity, $R_i \cdot L/E$ ($R_i \cdot L_o/E$), is used to compare the responsivity of photoconductive detectors of various formats and operate with different electric fields.

Time constant τ , ns

Typically, detector time response can be described by the one-pole filter characteristics. The time constant is the time it takes the detector to reach $1/e \approx 37\%$ of the initial signal value. The time constant is related to the 3dB high cut-off frequency f_{hi} :

$$\tau = 1/(2\pi \cdot f_{\text{hi}})$$

The time constant for one pole filter is related to 10-90% rise time t_r :

$$t_r = 2.2 \cdot \tau$$

Bias voltage-active area length ratio V_b/L , V/mm

Normalized photoconductive bias voltage for nonimmersed detectors.

Bias voltage-optical area length ratio V_b/L_o , V/mm

Normalized photoconductive bias voltage for immersed detectors.

Flicker noise 1/f

It is a frequency-dependent noise. It occurs in any biased devices.

1/f noise corner frequency f_c , Hz

Frequency, at which the low-frequency noise equals to the white noise (e.g. the Johnson or shot noise), the flicker noise dominates at $f < f_c$.

Resistance-active area product $R \cdot A$, $\Omega \cdot \text{cm}^2$

Normalized detector resistance for nonimmersed photovoltaic detectors. It is used to compare photodiodes with different sizes of active areas, in which dynamic resistance decreases proportionally to the detector active area.

Resistance-optical area product $R \cdot A_o$, $\Omega \cdot \text{cm}^2$

Normalized detector resistance for immersed photovoltaic detectors. It is used to compare photodiodes with different sizes of optical areas, in which dynamic resistance decreases proportionally to the detector optical area.

Active element temperature T_{det} , K

The detector active element temperature.

Acceptance angle Φ , deg

Acceptance angle is the maximum cone angle at which incoming radiation can be captured by a detector. Radiation coming from a larger angle will not reach the detector. In systems without external objectives, acceptance angle and field of view (FOV) are identical.

Infrared detection modules

The detection module integrates detector, preamplifier, thermoelectric cooler, and other components (detector biasing circuit, heat dissipation system, optics, etc.) in a common package. The operation of detection modules can be described in a similar way as for detectors, by specifying their spectral and frequency characteristics of responsivity and detectivity.

Voltage responsivity R_v , V/W

The output voltage is divided by the optical power incident on the detector. For spectra measurements can be expressed as:

$$R_v(\lambda) = R_i(\lambda) \cdot K_i$$

Low cut-off frequency f_{lo} , Hz

The minimum frequency at which a detection module gain reaches -3dB of the peak value or 0 for DC coupling devices.

High cut-off frequency f_{hi} , Hz

The maximum frequency at which a detection module gain reaches -3dB of the peak value. f_{hi} of the preamplifier may differ from f_{hi} of the detection module.

Noise measurement frequency f_0 , Hz

The frequency at which output voltage noise density is measured selectively.

Transimpedance K_i , V/A

Current to voltage conversion ratio:

$$K_i = \frac{V_{\text{out}}}{I_{\text{in}}}$$

Current signal I_{in} , A

Current signal from photodetector when exposed to incident radiant power.

Output noise voltage density v_n , nV/Hz^{1/2}

Noise voltage density measured at preamplifier output.

Output impedance R_{out} , Ω

Impedance that appears in series with the output from an ideal amplifier.

Load resistance R_L , Ω

Resistance of the detection module's load.

Output voltage V_{out} , V

The output signal of the detection module.

Output voltage offset V_{off} , mV

Output DC voltage of the detection module without input signal.

Power supply input $+V_{sup}$ and $-V_{sup}$, V

The supply voltage required for correct detection module operation.

Power supply current I_{sup} , mA

Supply current consumption during correct detection module operation.

GND

Point of zero potential. It is a common power supply ground and signal ground.

Ambient operating temperature T_a , °C

Ambient temperature during test measurements.

Thermoelectric coolers and thermoelectric cooler controllers**Active element temperature T_{det} , K**

The detector active element temperature.

Maximum thermoelectric cooler current I_{max} , A

Maximum current resulting in greatest ΔT_{max} .

Maximum thermoelectric cooler voltage V_{max} , V

Maximum voltage drop resulting in greatest ΔT_{max} .

Maximum heat pumping capacity Q_{max} , W

Q_{max} rated at $\Delta T = 0$. At other ΔT cooling capacity should be estimated as

$$Q = Q_{max} \cdot (1 - \Delta T / \Delta T_{max}).$$

Maximum temperature difference ΔT_{max} , K

ΔT_{max} rated at $Q = 0$. At other Q the temperature difference should be estimated as

$$\Delta T = \Delta T_{max} \cdot (1 - Q / Q_{max}).$$

Temperature stability, K

It indicates the possible error in the temperature on the thermoelectric cooler.

Temperature readout stability, mK

It indicates the possible error in a readout of the temperature of the thermoelectric cooler provided by the controller.

Detector temperature settling time, s

The time is taken by the cooling system to reach the appropriate temperature of the detector active element.

Maximum TEC output current, A

The maximum current that is provided by the controller to the thermoelectric cooler.

Output voltage range, V

Range of voltage on the output of the module.

Power supply voltage V_{sup} , V_{DC}

The supply voltage required for correct thermoelectric cooler controller operation.

Power supply current I_{sup} , mA

Supply current required for correct thermoelectric cooler controller operation.

Series resistance of the connecting cable, Ω

Material parameter. It is resistance of the supply cable. It depends on the cable length.

4.2 Detector's packages and infrared windows

Photo	Package type	Cooling	Window	Detector type
	BNC	uncooled	no	PC, PCI, PV, PVI, PVM, PVMI
	TO39	uncooled	no	PC, PCI, PV, PVI, PVA, PVIA, PVM, PVMI
	PEM-SMA	uncooled	yes	PEM, PEMI
	PEM-TO8	uncooled	yes	PEM, PEMI
	TO8	uncooled	no	PCQ, PVMQ
	TO8	TE cooled	yes	PC-2TE, PC-3TE, PC-4TE PCI-2TE, PCI-3TE, PCI-4TE PV-2TE, PVA-2TE, PV-3TE, PV-4TE PVI-2TE, PVIA-2TE, PVI-3TE, PVI-4TE PVM-2TE PVMI-2TE, PVMI-3TE, PVMI-4TE
	TO66	TE cooled	yes	PC-2TE, PC-3TE, PC-4TE PCI-2TE, PCI-3TE, PCI-4TE PV-2TE, PVA-2TE, PV-3TE, PV-4TE PVI-2TE, PVIA-2TE, PVI-3TE, PVI-4TE PVM-2TE PVMI-2TE, PVMI-3TE, PVMI-4TE

Uncooled detectors are typically provided in BNC or TO39 packages without the window.

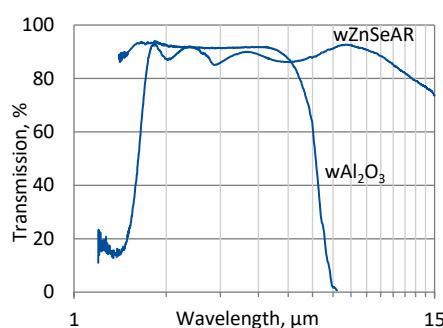

The exception is the specialized PEM package. Due to the magnetic circuit incorporated into the package, a 3° wedged zinc selenide anti-reflection coated (wZnSeAR) window is supplied to protect against external pollution. There are two versions of packages dedicated to photoelectromagnetic detectors:

- PEM-SMA with SMA signal output connector which makes it convenient in use,
- PEM-TO8 on TO8 header which enables integration with VIGO preamplifier.

Encapsulation

Thermoelectrically cooled detectors are mounted in metal packages: TO8 and TO66 sealed with IR windows. The packages are filled with dry, heavy, noble gases (Krypton / Xenon mixture) of low thermal conductivity. Water vapor condensation is prevented by a humidity absorber container mounted inside the package and careful polymer sealing. For low-temperature fluctuation, anti-convection shields are also applied.

Spectral transmission of wAl₂O₃ and wZnSeAR windows (typical example)

Infrared windows

We provide two types of windows as a standard:

- 3° wedged sapphire (wAl₂O₃)
- 3° wedged zinc selenide anti-reflection coated (wZnSeAR)
- 3° wedge prevents „fringing” – unwanted interference effects.

Material	Hardness, kg/mm ²	Wedging	Anti- reflection coating	Symbol
sapphire	1370	3°	no	wAl ₂ O ₃
zinc selenide	120	3°	yes	wZnSeAR

4.3 Thermoelectric cooling, temperature control, heat sinking

Thermoelectric cooling

Some of the VIGO devices are provided with thermoelectric cooling. Cooling of infrared detectors reduces noises, increases responsivity, shifts the cut-off wavelength toward longer wavelengths (in HgCdTe detectors) and toward shorter wavelengths (in InAs / InAsSb detectors).

Two-, three- and four-stage thermoelectric coolers are available. The operation of TE coolers is based on the Peltier effect. Thermoelectric coolers are supplied with a DC power supply.

Temperature control

Thermoelectrically cooled detectors are equipped with the built-in thermistor to provide precise control and measurements of detector active element temperature.

The electricity applied to between terminals of thermistors should be under the maximum power dissipation at 25°C (100 mW) not to destroy the thermosensor. For the measurement of resistance, the power should not exceed 1 mW.

The relation between the resistance and the temperature:

$$R_T = R_{T_0} \exp\left(\beta \cdot \frac{T_0 - T}{T \cdot T_0}\right)$$

$R_{T_0} = 2.2 \text{ k}\Omega \pm 3\%$ at $T_0 = 298 \text{ K}$

$\beta = 3500 \text{ K} \pm 1\%$

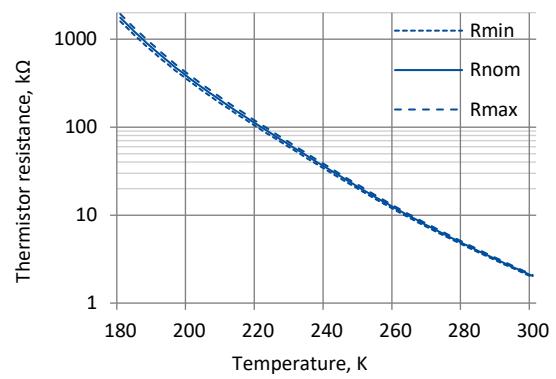

Thermoelectric coolers parameters^{*}

Parameter	Cooling		
	2TE	3TE	4TE
Active element temperature T_{det} , K	~230	~210	~195
Maximum TEC voltage V_{max} , V	1.3	3.6	8.3
Maximum TEC current I_{max} , A	1.20	0.45	0.40
Maximum heat pumping capacity Q_{max} , W	0.36	0.27	0.28

^{*}) Depend on the temperature of the hot side of the TE cooler.

Typically specified for 300 K.

Thermistor characteristics

Resistance vs. temperature of thermistor

Heat sinking

Suitable heat sinking is necessary to dissipate heat generated by the Peltier cooler or excessive optical irradiation. Since heat is almost 100% dissipated at the base of the detector header, it must be firmly attached to the heat sink.

A thin layer of heat conductive epoxy or silicon (thermal) grease should be used to improve thermal contact between the detector header and the heat sink to maximize heat transfer. Heat sinking via the detector cylindrical cap or via the mounting screw is not sufficient.

A heatsink thermal resistance of ~2 K/W is typically recommended for most 2TE and 3TE coolers. For a 4TE cooler, heatsink thermal resistance ~1 K/W is recommended.

Correct heatsink placement**Incorrect heatsink placement**

4.4 Optical immersion technology

In order to improve performance and get the best signal-to-noise ratio of the devices, optical immersion technology may be applied. It is successfully used in all types of VIGO detectors.

Optical immersion is monolithic integration of detector active elements with hyperhemispherical microlens (default). It makes the optical linear size of the detector active area 11 times larger compared to its physical size. This results in improvement of detectivity D^* by one order of magnitude. Also detector electric capacitance C_d is reduced by a factor of two orders of magnitude compared to the conventional detector of the same optical area. Acceptance angle Φ is reduced to $\sim 36^\circ$ – the microlens naturally shields background radiation which is one of the factors of noise. The hemispherical microlens is available as a custom option.

Optical power limitations for optically immersed detectors are more restrictive than for detectors without immersion microlens – for more information please see chapter **Precaution for use**.

Optically immersed detectors parameters

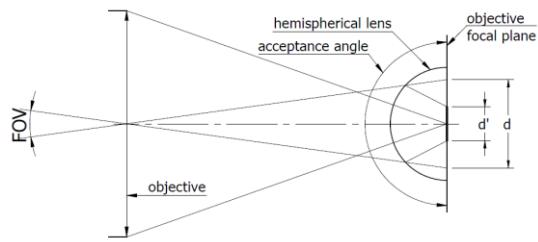

Parameter	Microlens shape			
	Hemisphere ^{*)}		Hyperhemisphere	
	Theory	GaAs	Theory	GaAs
Distance L	R	R	$R \cdot (n+1)$	4.3·R
d / d'	n	3.3	n^2	10.9
$D^*_{imm} / D^*_{non-imm}$	n	3.3	n^2	10.9
Acceptance angle Φ	180°	180°	$2\arcsin(1/n)$	$\sim 36^\circ$

^{*)} Custom option

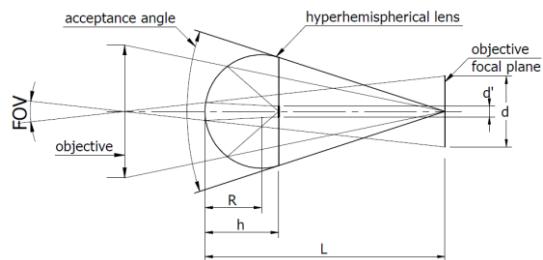

n – refractive index of microlens material (GaAs), n = 3.3, d – optical (apparent) detector size, d' – physical detector size, R – lens radius,

L – lens face to objective focal plane distance, h – lens thickness,
 $h = R + R/n$

Function and properties of hemisphere microlens

Function and properties of hyperhemisphere microlens

4.5 Precautions for use

Operating temperature

A detector should be operated at its optimal temperature given in the Final test report (delivered with every device).

Maximum voltage

Do not operate the photovoltaic detector at higher bias voltages than suggested in the Final test report (delivered with every device).

Be careful using ohmmeters for photovoltaic detectors!

Standard ohmmeters may overbias and damage the detector. This is especially true for a small physical area or SWIR photovoltaic detectors. The bias of 10 mV can be used for resistance measurements of any type of detector. Ask for conditions of I-V plot measurements!

Usage

Devices can operate in the 10% to 80% humidity, in the -20°C to +30 °C ambient temperature range. Operation at >30°C ambient may reduce performance for standard Peltier coolers.

Ask for devices that can operate in the +30°C to +80°C ambient temperature range.

Storage

The following conditions should be fulfilled for the safe and reliable operation of the detector:

- store in a dark place, 10% to 90% humidity and -20°C to +50°C temperature,
- avoid exposure to the direct sunlight and strong UV/VIS light as this may result in degradation of the detector performance,
- avoid electrostatic discharges at leads therefore, the devices should be stored having leads shorted.

Beam power limitations

Damage thresholds, specified as integrated power of incoming radiation:

- For devices without immersion microlens irradiated with continuous wave (CW) or single pulses of more than 1 µs duration, irradiated power on the active area must not exceed 100 W/cm². The irradiance of a pulse shorter than 1 µs must not exceed 1 MW/cm².
- For optically immersed detectors irradiated with CW or single pulse longer than 1 µs irradiance on the apparent optical active area must not exceed 2.5 W/cm². The irradiance of the pulse shorter than 1 µs must not exceed 10 kW/cm².
- For repeated irradiation with pulses shorter than 1 µs, the equivalent CW irradiation, average power over the pulse-to-pulse period should be less than the CW damage threshold according to the equation:

$$\text{equivalent CW radiation} = \frac{\text{pulse peak power}}{\text{power density}} \cdot \frac{\text{pulse}}{\text{duration}} \cdot \frac{\text{repetition rate}}{\text{rate}}$$

Saturation thresholds vary by detector type and can be provided upon request.

Handling

Particular attention should be paid to not scratching the surface of the window. A damaged window may entirely degrade the detector performance. Excessive mechanical stress applied to the package itself or to a device containing the package may result in permanent damage. Peltier element inside thermoelectrically cooled detectors is susceptible to mechanical shocks. Great care should be taken when handling cooled detectors.

Cleaning window

Keep the window clean. Use a soft cotton cloth damped with isopropyl alcohol and wipe off the surface gently if necessary.

Mechanical shocks

The Peltier elements may be damaged by excessive mechanical shock or vibration. Care is recommended during manipulations and normal use. Drop impacts against a hard surface are particularly dangerous.

Shaping leads

Avoid bending the leads at a distance less than 2 mm from the base of the package to prevent glass seal damage. When shaping the leads, a maximum of two right-angle bends and three twists at a distance minimum of 6 mm from the base of the package.

Keep the leads of the detecting element shorted when shaping!

Soldering leads

IR detectors can be easily damaged by excessive heat. Special care should be taken when soldering the leads. Usage of heat sinks is highly recommended. Tweezers can be used for this purpose; when soldering, clamp a lead at a place between the soldering iron and the base of the package. To avoid the destructive influence of ESD and other accidental voltages (e.g. from a non-grounded soldering iron) rules for handling LSI integrated circuits should be applied to IR detectors too. Leads should be soldered at +370 °C or below within 5 s.
